this volume contains a collection of 23 papers presented at the 4th french german conference on optimization hold at irsee april 21 26 1986 the conference was auended by

ninety scientists about one third from france from germany and from third countries each they all contributed to a highly interesting and stimulating meeting the scientifique program consisted of four survey lectures of a more tutorial character and of 61 contributed papers covering almost all areas of optimization in addition two informal evening sessions and a plenary discussion on further developments of optimization theory were organized one of the main aims of the organizers was to indicate and to stress the increasing importance of optimization methods for almost all areas of science and for a fast growing number of industry branches we hope that the conference approached this goal in a certain degree and managed to continue fruitful discussions between theory and applications equally important to the official contributions and lectures is the nonmeasurable part of activities inherent in such a scientific meeting here the charming and inspiring atmosphere of a place like irsee helped to establish numerous new contacts between the participants and to deepen already existing ones the conference was sponsored by the bayerische kultusministerium the deutsche forschungsgemeinschaft and the universities of augsburg and bayreuth their interest in the meeting and their assistance is gratefully acknowledged we would like to thank the authors for their contributions and the referees for their helpful comments

mathematical optimization and economic theory provides a self contained introduction to and survey of mathematical programming and control techniques and their applications to static and dynamic problems in economics respectively it is distinctive in showing the unity of the various approaches to solving problems of constrained optimization that all stem back directly or indirectly to the method of lagrange multipliers in the 30 years since its initial publication there have been many more applications of these mathematical techniques in economics as well as some advances in the mathematics of programming and control nevertheless the basic techniques remain the same today as when the book was originally published thus it continues to be useful not only to its original audience of advanced undergraduate and graduate students in economics but also to mathematicians and other researchers interested in learning about the applications of the mathematics of optimization to economics the book covers in some depth both static programming problems and dynamic control problems of optimization and the techniques of their solution it also clearly presents many applications of these techniques to economics and it shows why optimization is important for economics audience mathematicians and other researchers who are interested in learning about the applications of mathematical optimization in economics as well as students at the advanced undergraduate and beginning graduate level a basic knowledge of analysis and matrix algebra is recommended two appendices summarize the necessary mathematics

doctoral thesis dissertation from the year 2015 in the subject mathematics applied mathematics language english abstract this book comprises various optimality criteria duality and mixed duality in a variety of mathematical programming that includes nondifferentiable nonlinear programming problems nondifferentiable nonlinear fractional programming problems nondifferentiable minimax fractional programming problems etc mathematical programming is concerned with the determination of a minimum or maximum of a function of several variables which are required to satisfy a number of constraints such solutions are sought are sought in diverse fields including engineering operations research management science and economics often these situations are mathematical representations of certain real world problems and hence are turned as mathematical

programming problems optimality criteria and duality have played an important role in the development of mathematical programming optimality conditions were first investigated by fritz john and later on independently by karush and kuhn tucker the inception of duality theory in linear programming may be traced to the classical minmax theorem of von neumann which was subsequently formulated in a precise form by gale kuhn and tucker since then optimality criteria and duality have remained as one of the most widely investigated area in mathematical programming karush kuhn tucker conditions not only laid down the foundations for many computational techniques in mathematical programming but also are a great deal responsible for the development of the duality theory an extensive use of duality in mathematical programming has been made for many theoretical and computational developments in mathematical programming itself economics control theory business problems and many other diverse fields it is well known that duality principle connects two programs one of which called the primal problem is a constrained maximization or minimization problem and the other one called the dual is a constrained minimization or maximization problem in such a way that the existence of an optimal solution to one of them guarantees an optimal solution to the other and optimal values of the two problems are equal a pair of dual problems is called symmetric if the dual of the dual is the primal itself
